

## **The startup ENEBRA/CyberBank is based on a scientific theoretical foundation, a new science called Cybernomics.**

Currently, our society is facing continuous social-economic turmoil and a total crisis situation in the banking sector.

Three classic questions are posed to us by life itself!

1. What are we doing? A very important truth of a global scale has been revealed, solving problems of our human civilization. One less white spot on the planet. A new science at the intersection of cybernetics and economics has been established - cybernomics. It is simple, understandable, effective, though quite comprehensive.

2. Where is the root cause that generates consequential social and economic crises? The answer to the second question lies in the advancement of innovative knowledge and discoveries of the new science. Our goal as innovators is to draw your attention and provide you with a progressive idea and a device capable of directing your thinking towards natural truths rather than synthetic conclusions that lack a natural-organic basis. We urge you to think broadly and freely and not to forget that any movement towards development or progress is subject to the postulate of general psychology: observation - analysis - generalization - synthesis - action - result.

3. What is the correct solution - the answer? Money: it is the measure and motivator of our social interactions in the deep division of labor. Our innovative comprehensive toolkit, algorithmic-digital money transformed both in form and essence/system of their circulation/new institutional management structure and acceptable laws in the socio-economic sphere, form the basis of our future startup - CyberBank ENEBRA.

It is through our new comprehensive toolkit, integrated into a functional system device, that we can eliminate any man-made problems of modernity. And currently, there are not just a hundred of them, whether it be corruption, inflation, default, embezzlement, the shadow economy, lack of own financial resources for development, smuggling, counterfeiting, destructive financial pyramids, money or property theft in any form, infringement of copyrights or trademark counterfeit and much more.

Our startup ENEBRA, with its unique solutions and scientifically based model of accounting and regulation of intersectoral and interindustry balances, solves all these problems. The potential opportunities of the financial-economic model of the ENEBRA startup are unlimited. At the same time, the pyramid structures of state governance decrease to the size of a tent, and the quality and efficiency of management become incomparably higher.

## **The general idea - the principle and essence of the startup ENEBRA.**

A three-tier financial-banking distribution system.

1. The highest level - the Unified Public Settlement Bank DAO, which is organizationally and functionally separated from the state. The printing press has been abolished, as money exists in an abstract informational substance. The bank does not serve clients for purchase and sale transactions. Buyers and sellers do it themselves without the bank's involvement. This level bank conducts unrealized operations, including the movement of budgetary-public funds of various levels. It registers (opens and closes) entrepreneurship for up to one day. It collects revenues from sellers, disburses money to buyers from current accounts, conducts settlements for foreign trade operations. It collects all types of taxes, carries out primary processing of statistical data in various directions. The capabilities of this bank are not limited to processing information on commodity-money relations. The bank can be used to collect any information necessary for government decision-making or community management structure. It can fully integrate with the National Bank of Ukraine, as it has all the technical base, with expansion of peripheral devices, such as user gadgets and cash registers.

2. Personal level - Virtual bank of purchase and sale transactions. It represents a money mass available to all buyers and sellers in carriers of information within a specific and limited time interval. This level transforms the system into the most convenient and efficient form of settlements for purchase and sale transactions, using cash informational money both hand-to-hand and remotely via ready-made information communications.

3. Targeted level - Development banks, investment banks, or credit funds. Transformed from commercial banks to investment banks, they are the main organizers in meeting the identified needs of society and businesses (local or general). Development banks work with investment money towards the end result and have a fractional participation in it. With established norms of commodity-money relations, the financial resource of investment money is unlimited and does not create inflation. With such an innovation in society, there is no need for external borrowing if it possesses the knowledge, resources, and capabilities to involve them.

Development banks serve as the brain center linking needs with possibilities. This systemic model is unique in that any law or regulatory act regarding commodity-money relations is formalized with all mechanisms of execution - into the informational substance of money, and no member of the "DAO" community can violate it. This is purely an instrumental-organizational solution aimed at transitioning into a more highly organized and developed stage of social coexistence.

The systemic model is acceptable in any country and social formations, as its contour is filled with everything necessary that a specific community accepts in its traditions and

culture, regardless of faith. This allows for the preservation of the uniqueness of all the diversity of social organizations and forms.

The informational-integral economy is an advanced economy and banking system of modernity, based on fundamentally new money capable of carrying necessary scientific economic information. An economy based on Cybernomics will allow the construction of economic systems of a new high level and order that will not create artificial financial crises and social problems. Such a financial and banking model opens up new and broad opportunities for solving various economic and social tasks that are inaccessible for resolution in existing economic models.

An economic instrument with tremendous creative potential has been invented. The civil society - intellectual business community that first implements the informational-integral economy based on the innovative banking-financial crypto-system will have significant advantages compared to those indifferent to progress and their well-being...
